

(a) Conditional generative policy and command composition

(b) Three complementary policy measurements

Input response

Swap V or Q_{enc} ; fix Q_{act} and Z .

$$R_{\text{vis}} = \frac{D_V}{D_V + D_Q}$$

Report D_V and D_Q separately.

Command fidelity

Match demonstration commands.

$$\text{RMSE}(S^{-1}(\hat{A} - A))$$

Held-out windows; training-range scaling.

Feedback error

Compare the two replay branches.

$$G_\ell = \frac{\max e_{\text{auto}}^\ell}{\max e_{\text{teacher}}^\ell}$$

Fixed images; feedback $\hat{Q}_{k+1} = \hat{A}_{k,8}$.
